AI for QI: A Collaborative Exploration of Artificial Intelligence Application for Quality Health Outcomes

Event Description
The AI for QI symposium event represents an opportunity to unite collaborators representing four distinct views: patients, healthcare practitioners and policy leaders, research, and industry. Discussion will center on the advancement of AI application to support quality health outcomes, with a particular focus on the ethical challenges inherent in the integration of this technology. The symposium will feature expert keynote speakers addressing issues of health equity and ethics in this context. In addition, attendees will hear from each of the four partner perspectives and engage in multidisciplinary table talk sessions exploring the social implications of a rapidly evolving AI presence in health.

From this newly informed perspective, stakeholders will select project priorities and explore opportunities to form innovative teams well positioned to address future AI project calls. Structured networking opportunities are planned to allow members of this multidisciplinary gathering time to establish significant connections, while the creation of an online community will support ongoing collaboration and funding application.

Additional connectivity and resource sharing will be promoted using the symposium hashtag *#AI4QI*. The establishment of this social media channel is another means to sustain the multidisciplinary dialogue essential in addressing the equitable and ethical integration of AI in health. With planned provincial and national attendees, as well as invited keynote expertise, this symposium will serve as a catalyst for AI health research and project planning in Saskatchewan and beyond and create a lasting infrastructure capable of supporting multiple project teams.
